Experiment No. 4

C++ Program: Employee Constructors and Salary Calculation

```
#include <iostream>
#include <string>
using namespace std;

class Employee {
private:
    int empId;
    string name;
    float basicSalary;
    float bonus;
    float totalSalary;

public:
    Employee() : empId(0), name("Unknown"), basicSalary(0),
                 bonus(0), totalSalary(0) {
        cout << "Default constructor called" << endl;
    }

    Employee(int id, string n, float salary, float b) {
        empId = id;
        name = n;
        basicSalary = salary;
        bonus = b;
        calculateTotalSalary();

        cout << "Parameterized constructor called" << endl;
    }

    void calculateTotalSalary() {
        totalSalary = basicSalary + bonus;
    }

    void display() const {
        cout << "Employee ID : " << empId << endl;
        cout << "Name : " << name << endl;
        cout << "Basic Salary : " << basicSalary << endl;
        cout << "Bonus : " << bonus << endl;
        cout << "Total Salary : " << totalSalary << endl;
    }
};

int main() {
    Employee emp1;

    emp1.display();

    Employee emp2(101, "John Doe", 50000, 10000);

    emp2.display();

    return 0;
}
```
